The Information Split

DATA

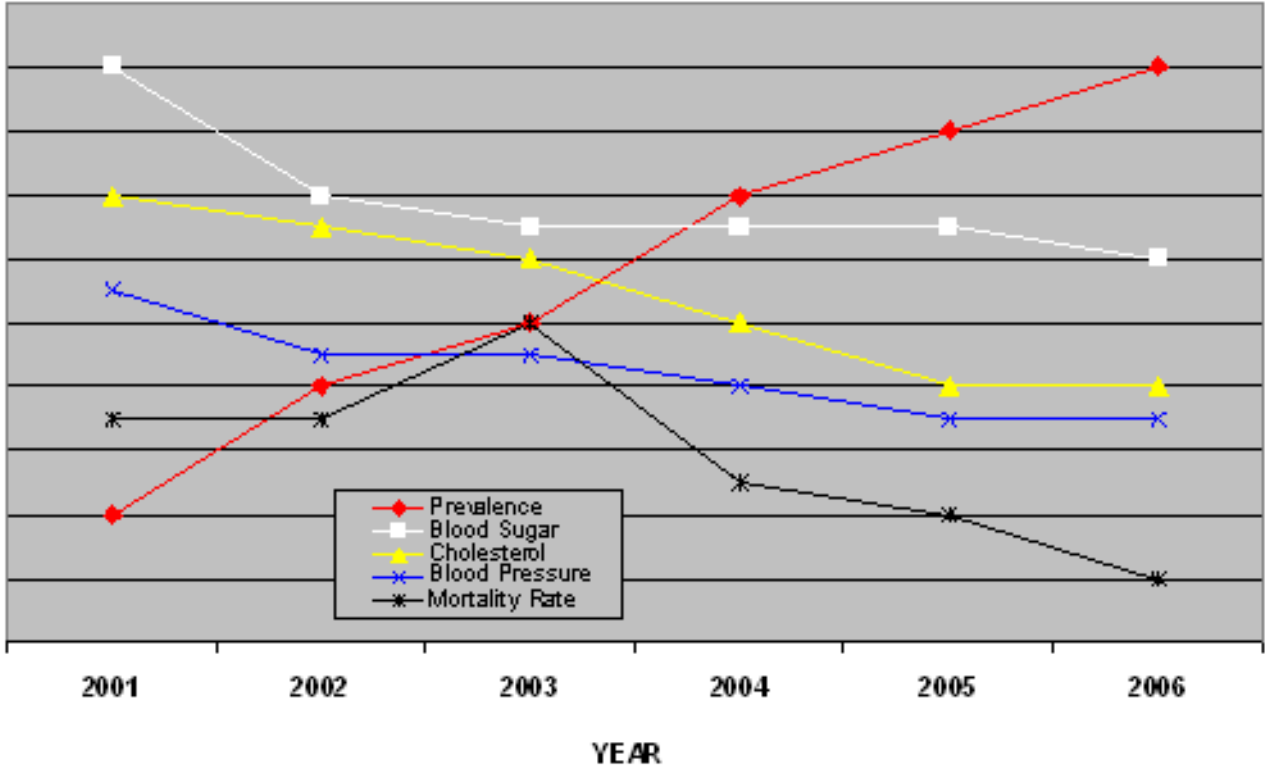

CLINICAL INFORMATION

Data sometimes shows you what you don't want to see!

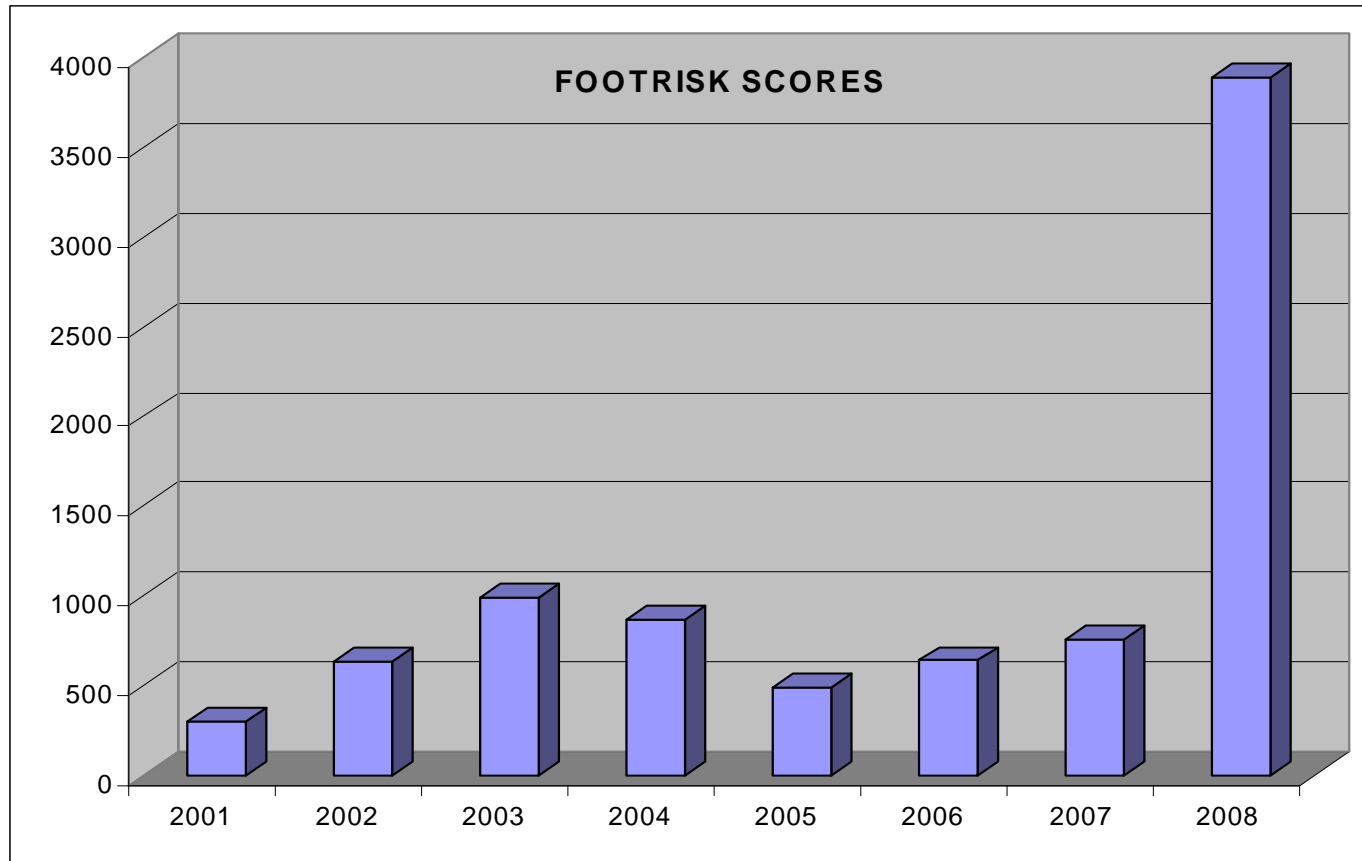

It sometimes shows you what you DO want to see!

**It sometimes shows you
complete untruths**

- **10 patients found that - according to Community Health Index (CHI) - were deceased**
- **All patients were still attending Secondary Care Clinics**
- **Life after death - range 1 - 4 years**
- **Resurrection Rate = 0.092%**

But mostly it shows you a pretty accurate representation of the situation

Neurological Assessment
 10 Gram Monofilament Sites
 Response = ● No Response = ○

Right Left

Feeling in only 8/10 sites or less?
 Significant Neuropathy = **Yes**

Neurological Symptoms Present (i.e. pain, paraesthesia, burning) Yes No

Other Risk Factors

Impaired Sight : Yes No

Callus : Yes No

Significant Foot Deformity : Yes No

Active Ulceration : Yes No

Previous Ulceration : Yes No

Physical Disability : Yes No

Risk Category
High

Foot Health Education Given : Yes No

Referral Status

Refer to Podiatry Dept. : Yes No

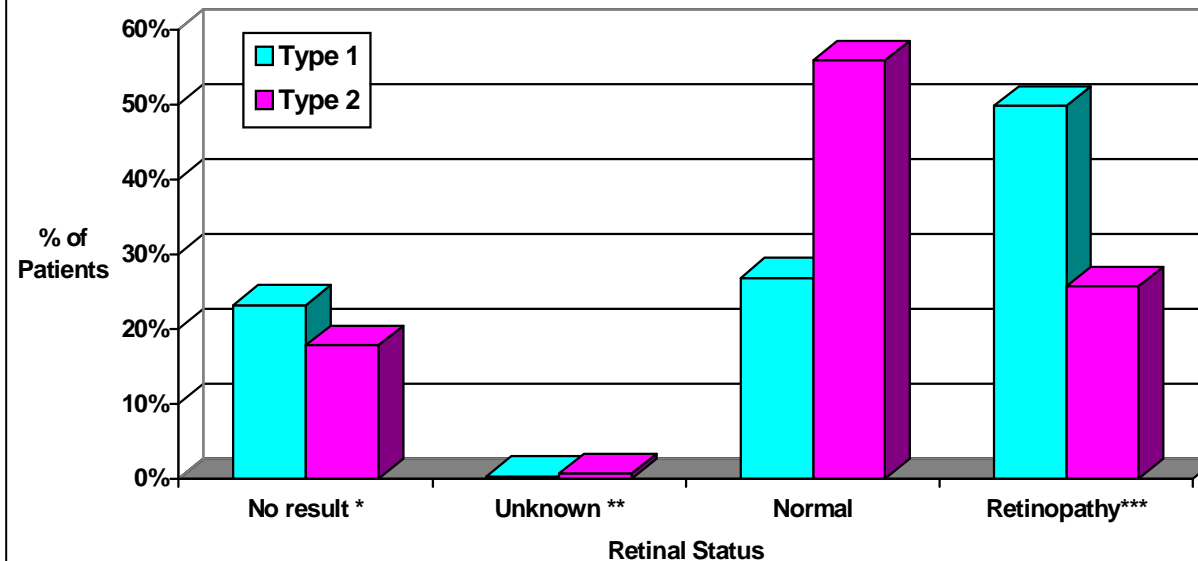

[Blank Referral Form](#) [Pre-Completed Referral Form](#)

Refer To Other Dept. : Yes No
 (specify)

Diabetic Retinal Screening (DRS) Programme

NOTE – Eye-screening is limited to Digital Image Photography or evaluation at an Ophthalmology clinic

- 81.6% (n= 13175) of patients underwent retinal screening during the report period
- Of those screened during the report period, 64.8% (n=918) of type 1 patients and 31.2% (n=3674) of type 2 patients had some degree of retinopathy
- Of those screened during the report period, 12.2% (n=173) of type 1 patients and 4.3% (n=500) of type 2 patients had maculopathy

*No Result is where no value was found or the last value was inappropriate (e.g. fundoscopy) or was prior to the report period

**Unknown is where an assessment was performed but the result was still pending or could not be determined due to the retina being obscured, etc

*** Includes maculopathy

Tayside Local Enhanced Service (LES)

Diagnoses of Diabetes

- **Practices encouraged to formally register all type 2 patients via a SCI-DC online Diabetes Administration webform - includes referral to Tayside Diabetes Education Programme (TDEP - type 2 specific)**
- **Tayside insulin management (TIM - type 1 specific)**
- **Feedback of inappropriate attendees by DSNs, Dietitians and educators**

“Look after the pennies and the pounds will look after themselves”

In a data context

“Look after the patients and the populations will look after themselves”

Some general points

- **Data is like a currency – it can “buy” things (static eye-screening site)**
- **Understand its strengths and weaknesses and incorporate this into your data use**
- **Identify available “gold standards” (e.g. biochemistry from labs vs GP or other non-lab systems)**
- **If possible, create your own gold standards (Footrisk forms, Eye Screening programmes, Type specific education sessions)**
- **Liaise with data providers and system users – who all share the desire for accurate information**

Observations

- **Large datasets will never be 100% accurate but they can absorb some error effects**
- **Strategies that encourage “clean” clinical recording entry minimise “dirty” data contamination**
- **The job of creating adequate datasets will never be finished – changes in clinical standards and thinking will make sure of that**
- **The job of striving to create adequate clinical datasets will always be worth doing.**
