

# **WP7: REPORTS TEMPLATE**

University of Bergen

# Rationale behind templates

- DEF: “A “template” is a document or file having a preset format, used as a starting point for a particular application so that the format does not have to be recreated each time it is used.”
- “WP7 will define a structure for diabetes health reports that could be used across international regions”

# Audience?

- Patients and their families
- Caregivers, academics, researchers
- Policy / decision makers

➤ Suggestion:

Reporting templates will to try to maintain these three profiles through the reports

# Data items / indicators

- **Data items** collected based on WP 2: Clinical review
  - Items as basis for reporting, from all partners in BIRO
  - Data from other sources available?
  - Data from other sources possible?
  - Data from other sources feasible?
- The backbone for reporting has to be WP2 with definitions

**Examples** of templates and diabetes reporting from across the world  
and

**Pointers** to web-pages showing examples of reports

- See document provided and links within
- Examples that BIRO should look more closely at?

# Challenges in development

- Very little detailed descriptions of templates in the available diabetes/medical literature
- Web-sites provide ideas but hardly "how to do it"
- BIRO needs to decide on audience, levels of details and format

# Further work

- Keep working and search for examples
- University of Bergen does not have the data or reporting schemas yet to provide a template directly – it will have to be developed along with this WP
- Recommendations from other partners?
- Help with detailing how the format of WP 7 is to be! Both,
  - As a document
  - A a practical giude for content and programming
