B.I.R.O.

Best Information through Regional Outcomes

Statistical Interpretation

Fabrizio Carinci,
BIRO Technical Coordinator, University of Perugia

Rome Meeting
3 December 2007

Problems identified

- Timescale (use of repeated measures)
- Gaps in the quality of data
- Heterogeneous results (stratified analysis)
- Better specifications in the report template
  - How to use repeated measures (averages, last measures, time frames?)
  - How to use time dependent variables (age, diabetes duration..?)
  - Does it make sense to use variables e.g. weight?
  - Need of additional epidemiological measurements?
  - Scale of the axes
  - Standardization?
